

Description: Submit a description below of the idea for your website project. This proposal should be 50-100 words.

Since I could remember, video games have always been something that I enjoyed back then, now, and probably forever. In 2017, I decided that PC gaming would be something that I wanted to dive into and thus I decided to build my own computer. Now, I have been building computers for others and upgrading my own as technology continues to evolve. For this project, creating a website that explains what is inside a computer would be knowledgeable for someone to know if they ever have any issue with any component. Showing a computer built entirely might be too complicated.

3 Pages: Include some information about what will be on each of the three pages in your website.

1. What will be on the home page?
 - For the home page, explaining how a computer works and different types of computers that are available, such as a prebuilt, server, or others would be useful. Having images and pros and cons is another feature I want to implement.
2. What will be on the 2nd page?
 - This page will cover the components of the computer and have a detailed description of what they do. I will show the different models for each component and give a recommendation of what should be used to properly maximize the performance of a computer.
3. What will be on the 3rd page?
 - This final page will go over how much someone should spend on each component given their situation. An example would be a gaming PC, where someone should spend a lot more money on a CPU, GPU, and ram to maximize performance in their games.
